

Intune Weekly

Your weekly briefing on what's next in Microsoft Intune

COVERING APRIL 21 - 27, 2026

Curated by Ugur Koc

Samsung Knox wipe-block locks devices permanently; Autopatch report shows zero devices for weeks.

BROUGHT TO YOU BY

ON THE RADAR

Samsung Knox OEMConfig wipe-block bricks devices permanently

Deploying a KSP profile that blocks device reset enforces at firmware level with no recovery path - do not push to production without a validated recovery procedure.

REDDIT

Autopatch 'Managed for quality updates' report showing zero devices

The report has been broken for weeks across multiple tenants, silently undermining compliance reporting - raise a support case now if affected.

REDDIT

Microsoft Defender now assesses Secure Boot 2023 certificate readiness fleet-wide

New Defender capability auto-categorizes devices as exposed, compliant, or not applicable with remediation guidance attached - useful directly against the 'Under observation' pain admins are reporting.

MICROSOFT - RELEASE HEALTH

AI-speed CVE exploitation raises the bar for patch currency

Microsoft's customer success team warns that AI-assisted exploit discovery collapses the safe response window, making proactive Autopatch ring configuration a baseline requirement now.

COMMUNITY SPOTLIGHT

Janic Verboon

EAM-AutoUpdater

Built EAM-AutoUpdater, a free PowerShell automation that watches the Intune Enterprise App Catalog for new app versions, deploys them, and migrates assignments, scope tags, and Enrollment Status Page references from the previous version. Turns a recurring manual chore into an Azure Automation runbook.

Landing in your tenant soon

New IT admin policy: Remove Microsoft Copilot app

INFO **ALL** **WIN** MICROSOFT - RELEASE HEALTH - A new RemoveMicrosoftCopilotApp policy setting (Policy CSP and Group Policy) lets admins uninstall the standalone Copilot app from devices that also have Microsoft 365 Copilot installed, where the user has not launched the app in the last 28 days. Useful for consolidating onto a single Copilot surface without disrupting active users.

On the horizon

Keeping current is the new patching strategy as AI accelerates vulnerability discovery

INFO **ALL** **CROSS** MICROSOFT - LEARN - Microsoft's customer success team argues that AI-assisted exploit discovery is shrinking the window between CVE disclosure and active exploitation, making broad patch currency - not just individual CVE response - the baseline for exposure reduction. Admins should review Autopatch and update ring configurations to ensure fleet-wide currency is maintained proactively.

Autopilot Device Preparation (v2) enterprise readiness still in question for large-scale deployments

ADVISORY **ENT** **WIN** **1 REPORT** BLOG - DISCUSSIONS - Community practitioners evaluating Autopilot v2 report that the absence of Group Tag support and limited dynamic group targeting make it unsuitable for large enterprise naming and segmentation models, with most staying on v1 for now. Admins at scale should re-evaluate when Group Tag parity is confirmed on the roadmap.

EPM network adapter elevation support reportedly in development

INFO **ENT** **WIN** **SUITE** **1 REPORT** REDDIT - R/INTUNE - A community member reports that Microsoft is working on a feature to allow EPM elevation for NIC/IP configuration changes via Company Portal, addressing a gap that currently forces admins toward the Network Operator group with undesirable UAC side-effects. No timeline has been shared.

"Unpacking Endpoint Management" series returns with engineering and product team involvement

INFO **ALL** **CROSS** BLOG - CUSTOMER SUCCESS - Microsoft has relaunched the Unpacking Endpoint Management video/discussion series featuring Intune, Security, and Customer Experience engineering voices, promising candid practical guidance rather than marketing content. Worth bookmarking for teams planning architecture reviews.

Ask Microsoft Anything: Secure Boot certificate updates (April 23 and May 18)

INFO **ALL** **WIN** MICROSOFT - RELEASE HEALTH - Microsoft is running two live AMA sessions on Secure Boot 2023 certificate rollout ahead of the June 2026 expiry, covering how to identify affected devices and plan organization-wide rollout. Add the April 23 or May 18 session to your calendar if your fleet still shows non-compliant devices.

Action required

Samsung Knox OEMConfig wipe-block policy renders devices unrecoverable - test before broad deployment

CRITICAL **ENT** **AND** **CONFIRMED** REDDIT - R/SYSADMIN - Admins report that deploying a Knox Service Plugin OEMConfig profile that blocks device reset enforces the restriction at firmware level; Intune reports wipe success but the device retains KSP policy, and with Download Mode disabled on newer firmware there is no recovery path. Do not deploy wipe-block OEMConfig profiles to production Samsung devices until you have validated a recovery procedure in a test environment.

What shipped

Microsoft Defender now provides centralized Secure Boot 2023 certificate readiness assessment

ADVISORY **ALL** **WIN** MICROSOFT - RELEASE HEALTH - IT teams can now see fleet-wide Secure Boot 2023 certificate readiness in the Defender portal under Exposure Management > Recommendations > Devices > Misconfigurations, with devices auto-categorized as exposed, compliant, or not applicable and remediation guidance attached. This directly addresses the community pain around "Under observation" status confusion called out in From the Field below.

From the field

Local admin removal project: EPM audit-first approach and change management are the consensus best practice

ADVISORY **ALL** **WIN** **SUITE** **CONFIRMED** REDDIT - R/SYSADMIN - A widely-upvoted thread (650+ points) and a parallel r/Intune thread confirm the same pattern: run EPM in audit mode against pilot cohorts first to group elevation hits by publisher/path, and communicate the change to the business before you act - not after users lose rights. Intune Account Protection policies (no script needed) can replace local admin group membership natively.

Secure Boot certificate update: "Under observation" status and UEFICA2023Status "Not started" on majority of fleet

ADVISORY **ALL** **WIN** **CONFIRMED** REDDIT - R/SYSADMIN - Multiple admins report that Microsoft's monitoring remediation script returns "With issues" on a large proportion of devices even where PatchMyPC shows the new certificates present, with the leading theory being that MS checks for both the new cert and the updated bootloader signed with it. Community recommends the mindcore.dk detection/remediation script, which staggers opt-in and enforced update over 30 days and has been validated against HP fleets of 3,000+ devices.

Autopatch "Managed for quality updates" report showing zero devices for weeks

ADVISORY **ENT** **WIN** **CONFIRMED** REDDIT - R/INTUNE - Multiple admins confirm the Autopatch management status report has been reporting zero devices managed for quality updates for several weeks despite devices actively receiving updates; feature and driver update counts remain accurate. No Microsoft acknowledgement yet - raise a support case and reference the thread if this affects your compliance reporting.

Windows Updates not applying at Device ESP phase during Autopilot pre-provisioning

ADVISORY **ENT** **WIN** **CONFIRMED** REDDIT - R/INTUNE - Admins confirm that the new OOBE Windows Update feature in the Enrollment Status Page only triggers at the User ESP phase, not Device ESP, meaning pre-provisioned devices hand off to users who must then wait through update installation. Community workarounds include a PowerShell app assignment targeting the device group that calls PSWindowsUpdate during device phase.

Hotpatch on 24H2: ARM64 devices silently excluded without an additional config profile

ADVISORY **ENT** **WIN** **CONFIRMED** REDDIT - R/INTUNE - Admins who enabled Hotpatch at GA report that ARM64 devices did not receive hotpatch updates until a separate configuration profile was deployed - a requirement that was not prominently documented at rollout. Additionally, one admin noted a subsequent large portion of their fleet missed a Secure Boot update cycle; review ARM64 coverage before assuming fleet-wide hotpatch adoption.

Intune device list throwing "Unable to fetch any device" errors - transient but recurring

ADVISORY **ALL** **CROSS** **CONFIRMED** REDDIT - R/INTUNE - Multiple admins reported the Intune portal device list returning "Something went wrong. Unable to fetch any device" errors; the issue resolved for most reporters within hours and Microsoft could not reproduce it from their side. No root cause posted - monitor Service Health if the error persists in your tenant.

EntraMap: open-source visual relationship mapper for users, groups, apps, and Conditional Access

INFO **ALL** **CROSS** **1 REPORT** REDDIT - R/INTUNE - A community developer has released EntraMap (entramap.com / GitHub: enginsoysal/EntraMap), a free open-source tool that renders a visual graph of Entra ID relationships including CA policy linkages and safe-to-delete analysis. Early release - note that some corporate networks with strict domain-age filtering will block the new domain.

Logic App for proactive Apple certificate and token expiry alerting in Intune

INFO **ALL** **IOS** **1 REPORT** REDDIT - R/INTUNE - An admin has published a Logic App template that polls Graph API for expiring APNS certificates, VPP tokens, and DEP tokens and posts alerts to Teams, addressing the gap where Microsoft's own email reminders are sometimes missed. Source and deployment guide at zerotruststories.com.

Platform SSO on macOS requires ADE/ABM enrollment - user-driven Company Portal enrollment is not sufficient

ADVISORY **ALL** **MAC** **CONFIRMED** REDDIT - R/INTUNE - Admins confirm that enrolling existing MacBooks via Company Portal (user-driven, without ABM) achieves MDM management but Platform SSO / Entra ID login at the macOS lock screen requires ADE-enrolled devices; Apple Configurator 2 via iPhone can add devices to ABM but requires a wipe. Plan accordingly for in-use devices where downtime is not acceptable.

GAL contacts not surfacing in iOS native dialer - no clean Intune-native solution exists

INFO **ALL** **IOS** **CONFIRMED** REDDIT - R/MICROSOFT365 - A commonly-reported gap: Exchange GAL is searchable within Outlook Mobile but does not populate the iOS system contacts store, so incoming calls from colleagues show as unknown in the native dialer and WhatsApp. Community workarounds include third-party sync tools (galynski.com) and PowerShell-based local mailbox contact creation; no native Intune or Entra control addresses this.

Autopatch UpdateDeferredVersions registry value behaviour under active investigation by community

INFO **ENT** **WIN** **1 REPORT** BLOG - DISCUSSIONS - An admin is trying to understand how Autopatch writes the UpdateDeferredVersions FileTime value to the Office C2R registry key and whether policy changes trigger a reset, with no clear Microsoft documentation available. If you rely on this key for compliance or audit scripts, validate its behaviour in your own environment before drawing conclusions.

Autopilot-only app deployment: defaultuser0 requirements script is the cleanest gate

INFO **ALL** **WIN** **CONFIRMED** REDDIT - R/INTUNE - Admins confirm the most reliable way to deploy an app exclusively during Autopilot enrollment (and not to existing devices) is a requirements script that checks for the presence of the defaultuser0 account, preventing installation on already-enrolled machines without maintaining a static exclusion group.
